

OCTOBER 2026
VERSION 2.0 DRAFT
PUBLIC DOCUMENT

DAOASIS

Whitepaper *2026*

An app-first wellness ecosystem in which daily participation is recognised, recognition can become standing, and the people who build the thing are able to hold a position in it.

DAOasis

CONTENTS

What it is, how it works, and what is *not* decided yet.

This is the description of the DAOasis ecosystem that the company's other documents refer to. It is published openly, it carries no price and no return, and it says on the page where the design stops and the open questions begin.

Where the numbers live

This paper states the token model in principle and does not repeat its figures. Supply, allocation, vesting, treasury policy and governance parameters are set out once, in the **DAOasis Tokenomics Paper 2026**.

Status is on the page

Almost nothing described here is operating yet, so each section says what is **built**, what is **designed** and what is **undetermined** at the point where it says it.

What this is not

Not an offer, not a financial promotion and not investment advice. No price, yield, return or listing appears anywhere in it, because none exists. The full statement is on the last numbered page.

00 · THE THESIS, IN ONE PAGE

Wellness apps create users. This one creates *stakeholders.*

DAOasis is an app-first wellness ecosystem that helps anyone build durable routines, learn why they work, and stay accountable to other people — while optional immersive experiences deepen the practice and a single, simple token model lets long-term participants hold a position in what they helped build.

BUILT

- DAOasis Global Ltd (UK), incorporated and live.
- The brand, and a public website across thirteen pages.
- The Companion App's MVP design — 74 screens across five tabs.
- The App Product Logic — every rule the screens run on.
- The quest system, specified across the six habits with three-tier verification.
- The credit economy — an award table, daily caps, no streaks.
- Two curriculum tracks, specified to four depth levels each.

DESIGNED, NOT BUILT

- The daily loop working end to end, and Reward Credits in the app.
- The launch Journey, playable from Bangkok to Phuket.
- $DVT, the on-chain layer, and everything that depends on it.
- Conversion from Reward Credits toward $DVT.
- The marketplace, and Stake to Create.
- Governance moving from founders-led toward member decision.
- The Sanctuary, tested first through a partner.

NOT DETERMINED

- The chain, the wallet method, hosting and data residency.
- Whether $DVT may lawfully be offered, and in which jurisdictions.
- The conversion rate, its caps, its eligibility test and its timing.
- Whether staking and governance as designed are regulated activities.
- Retention, pricing and unit economics — proposed, none tested.
- The Sanctuary property. None is contracted, leased or confirmed.

THE WHOLE DESIGN IN ONE SENTENCE

Participation earns recognition inside the app; recognition can, for members who choose it, become a position in the ecosystem that produced it. Everything else in this paper is the machinery that makes that sentence safe to say.

AND WHAT IT DELIBERATELY IS NOT

There is no price here, no yield, no market and no return. DAOasis is pre-launch, with no members and no revenue. A whitepaper that promised performance at this stage would be describing something other than what has been built.

Rest. Learn. Earn. Return.

01 · WHAT IS NOT WORKING

Information is not *behaviour.*

People have never had more wellness information, more tracking or more content available to them. Consistency has not improved to match. That gap is the whole reason DAOasis exists, and it is a systems problem rather than a content problem.

01

Attention is already fully spoken for

The people most exposed to burnout — remote-first, digitally connected, carrying a high cognitive load with little structural support — are also the most fragmented. Routine is the first thing to go, and it goes quietly.

02

Behaviour is measured in silos

Steps live in one app, sleep in another, learning somewhere else entirely. Nothing accumulates and nothing compounds, so a good week and a bad week look much the same by Friday.

03

Tracking is not a reason to come back

Most wellness products are optimised for subscription conversion or content consumption. They record what somebody did without giving them a reason to do it again tomorrow.

04

Progress has nowhere to go

Even where consistency is achieved it stays abstract — a number, a streak, a graph. It does not turn into standing, into a say in anything, or into something a person can hold.

WHY THIS IS THE RIGHT PROBLEM TO ATTACK

The behavioural-engagement literature finds engagement strongest when four things are present together: goal tracking, feedback, reward and social accountability. Fragmented tracking can deliver one or two of them. It cannot deliver all four, because they are not four features — they are one loop, and a loop only works when it closes.

What that implies for the product

If the failure is structural, the answer cannot be more content or a better graph. It has to be a system where every positive action feeds the same thing, where progress is legible enough to describe out loud, where other people are expecting you, and where consistency accrues into something that outlasts the streak.

BASIS. THE FOUR FAILURE MODES ABOVE ARE DAOASIS'S OWN CHARACTERISATION OF THE CATEGORY, FORMED DURING FEASIBILITY WORK; THE ENGAGEMENT FRAMING DRAWS ON PUBLISHED BEHAVIOURAL-ENGAGEMENT RESEARCH. NEITHER IS A MEASURED FINDING ABOUT A NAMED COMPETITOR, AND NEITHER IS A CLAIM ABOUT OUTCOMES DAOASIS HAS PRODUCED.

02 · WHY NOW

Large markets do not make durable products. *Convergence does.*

Preventative wellness, behavioural technology, digital learning, community platforms, experiential hospitality and digital ownership are each substantial categories on their own. What makes this moment different is that the behavioural gap, the technology to close it and everyday comfort with participation-based platforms have arrived at the same time.

THE CATEGORIES — each substantial on its own, and each converging on the same person

$6.8T

The global wellness economy in 2024 — larger than IT, tourism or pharmaceuticals. The category DAOasis operates inside.

Global Wellness Institute, 2024

$37.5B

The mobile-health applications market in 2024, the Companion App's immediate category — projected to reach $86.37B by 2030.

Grand View Research

$894B

Wellness tourism in 2024 — the category the Sanctuary pilot sits inside, and part of why the pilot is planned in Thailand.

Global Wellness Institute, 2024

THE SIGNAL UNDERNEATH THEM — the reason those categories are growing at all

44%

of employees worldwide report experiencing stress, and 20% report loneliness — younger and fully remote workers most affected. This is the demand signal underneath the category numbers.

Gallup, State of the Global Workplace

562M

Estimated digital-asset owners worldwide in 2024. Context for the ownership layer, not a target segment: DAOasis is designed to work fully for people who will never join that number.

Triple-A, 2024

7.6M+

Visitors to Phuket between January and July 2025 — an established wellness-tourism destination with mature hospitality infrastructure and strong international access.

Tourism Authority of Thailand

How to read these figures

Every figure on this page is a third-party market reference, given to show the scale of the categories DAOasis operates in. None of them is a DAOasis revenue figure, forecast or addressable-market claim, and DAOasis makes no claim to any share of any of them. The company is pre-launch and pre-revenue.

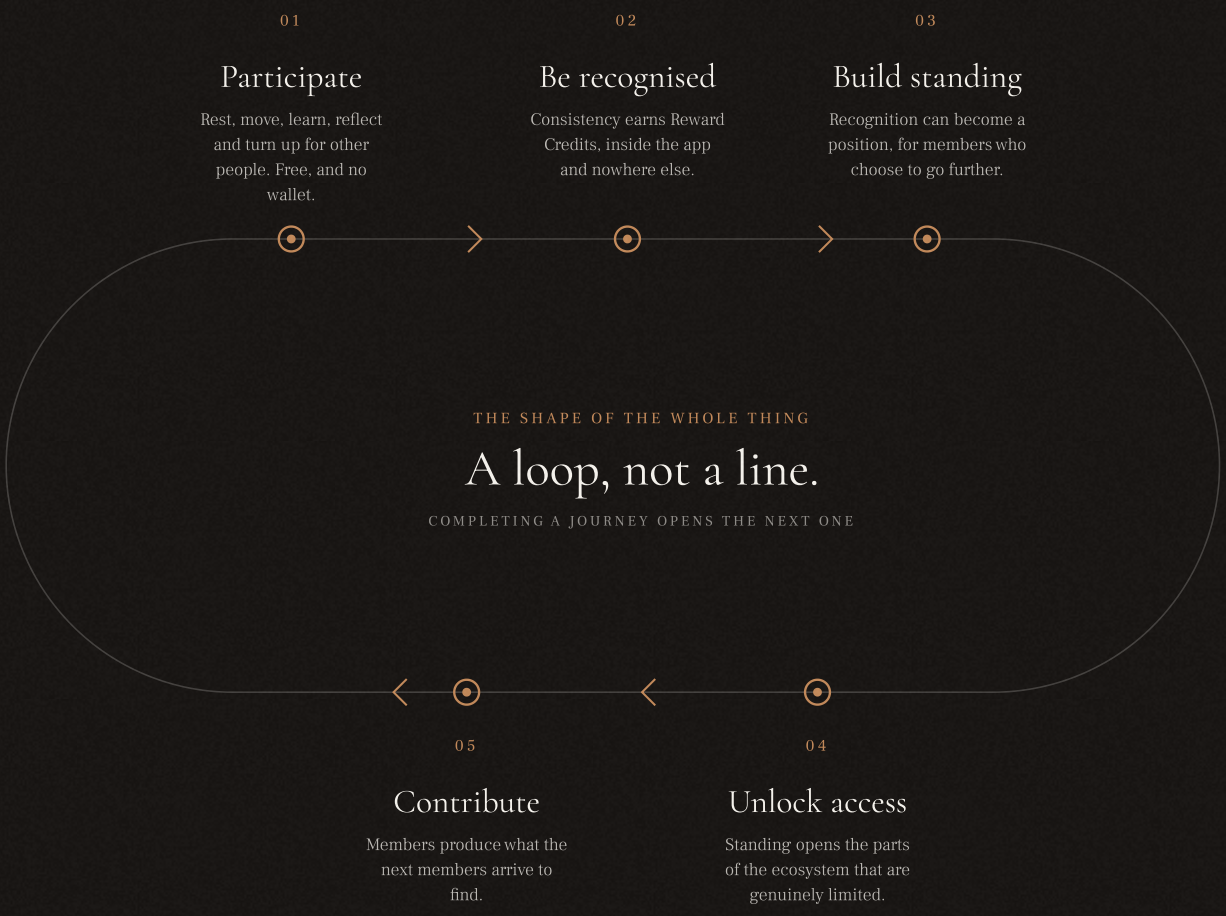

The part that is not a market number

Comfort with participation-based platforms has changed faster than any of these figures. People are used to earning standing inside a system by turning up for it. What has not existed is a version of that built around a person's own health, on terms that do not require them to buy anything to begin.

03 · WHAT DAOASIS IS

An ecosystem, and the Journeys *inside it.*

DAOasis is the ongoing ecosystem. A **Journey** is a repeatable experience inside it, and completing one opens the next. Bangkok to Phuket is the launch Journey — the first instance of the format, not the extent of it, and not the product.

Three layers, in sequence

The **Companion App** is the core operating environment and the scalable foundation every later product reaches the member through. Above it sits the **recognition and ownership layer**, which turns consistent behaviour into standing. Above that sit **real-world experiences** — the marketplace, partners and the Sanctuary — which are optional, and which send members back to the first layer with a better reason to continue.

The test worth applying

Ask of each layer what would happen to the others if it failed. If the app fails, nothing above it exists. If the ownership layer is delayed, the app still works and Reward Credits still recognise participation. If the Sanctuary slips, the Journeys, the learning and the daily loop carry on untouched. That asymmetry is deliberate, and it is why the sequencing runs app first.

Status

The loop above is the design, not a description of something operating. The Companion App is in build; Reward Credits are the first reward mechanic to ship; the ownership layer, the marketplace and the Sanctuary are all designed and none is live. Nothing on this page has been tested with members, because there are no members yet.

04 · THE COMPANION APP

The core operating environment of *everything else.*

The app is where a member builds routines, tracks the behaviours that matter, learns, earns recognition, moves through a Journey, takes part in a community and finds experiences. It is the daily relationship, and it is built first — because if the daily loop does not earn its place on wellness merit alone, nothing else here matters.

Free at the door

Download it, connect a health platform, start walking. No wallet, no token and no crypto literacy required — not as a trial, but as the permanent shape of the entry point. A member can participate for years and never touch the on-chain layer.

Six habits, one Journey

Move, Rest, Breathe, Hydrate, Nourish and Learn. Each is verified at one of three tiers — read automatically, logged by the member, or taken on trust — weighted by how confirmable the action honestly is. Each habit changes something on the Journey: distance, the route, a waypoint's story.

Progress you can describe out loud

"7,400 steps" means very little on its own. "Eleven kilometres past Hua Hin" is a position a person can hold in their head and want to improve. That translation — from a metric into a place — is what the whole daily loop rests on.

How a member moves through it

STEP ONE

Discover

FREE · WELLNESS-FIRST

Arrives for the health product, not for the ownership layer. Most people will never need to know it exists.

STEP TWO

Engage

QUESTS · ROUTE · COHORT

Daily behaviour turns into distance. Consistency compounds rather than resetting every Monday.

STEP THREE

Transform

NOT MOTIVATION

Learning turns a tracked behaviour into a decision a member can defend to themselves on a bad week.

STEP FOUR

Continue

OPTIONALLY, MORE

The next Journey opens. Whether a member goes further than recognition is entirely their own choice.

Device integrations

Apple HealthKit and Google Health Connect are the two priority integrations for the app's first release. Whoop, Oura, Garmin and Fitbit are designed but not committed to it. Where no platform is connected, manual logging and honour-system verification are designed in as fallbacks.

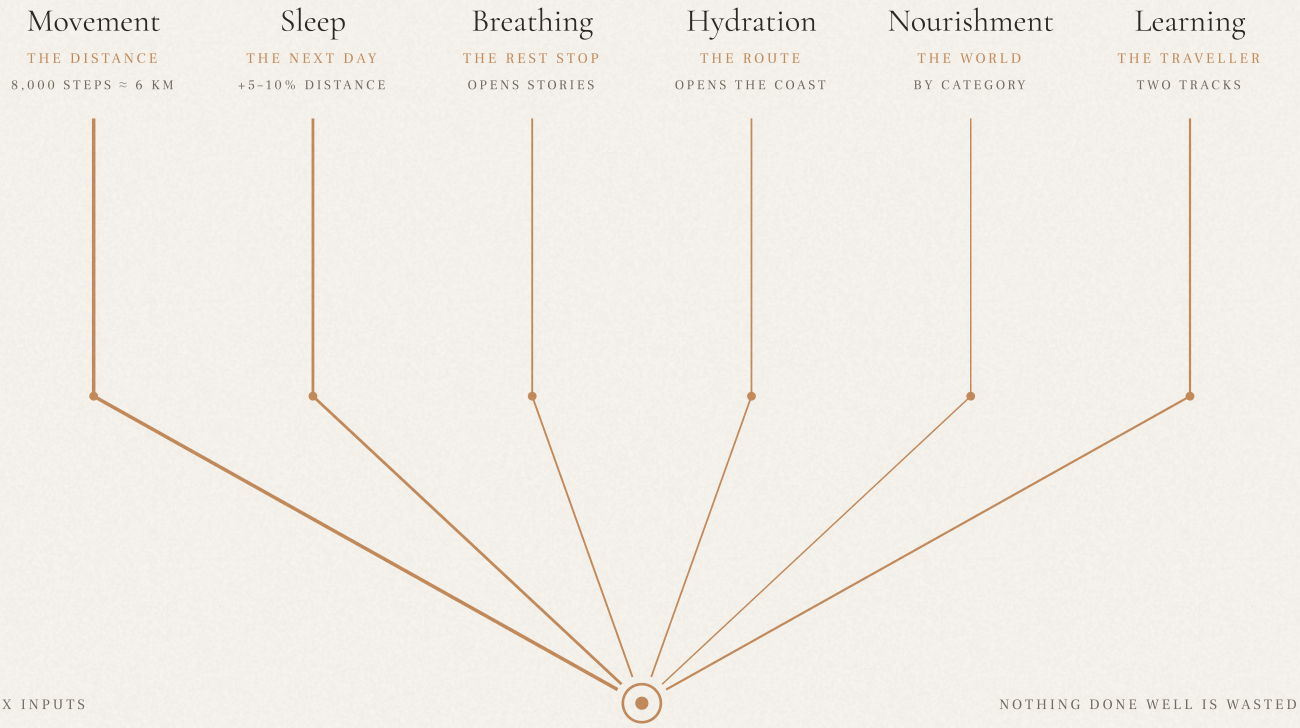

Status

The MVP design is complete — 74 screens, the rules behind them and a clickable web prototype — and the quest system, credit economy and curriculum are specified. In build: the end-to-end daily loop, Reward Credits, the two integrations and the launch Journey. Nothing here is available to download today.

05 · SIX INPUTS, ONE JOURNEY

Six inputs. *One output.*

Conventional wellness products treat these as six independent scores competing for the same attention. DAOasis treats them as six inputs to one output: progress along the Journey a member is currently walking. Every positive action moves the same marker, and together they compound.

The Journey

Every habit moves the same marker along the same route. The launch Journey runs 900 km, Bangkok to Phuket.

It gives every metric one place to go

Breathing, hydration and sleep are not separate scores in separate corners of an interface. They are inputs to the same number — which is precisely why a member has a reason to care about all of them at once, and why a strong night's sleep makes a modest day's walking count for more.

Nothing done well is wasted

A member who cannot walk this week can still breathe, hydrate, sleep, eat well and learn, and still move. That is the difference between a system that punishes a bad week and one that absorbs it — and it is the honest answer to why most streaks break.

Status

The Journey mechanic, its waypoints and the relative weight of each input are specified at product-design level and are being implemented in the app build. The exact contribution of each habit is a tuning decision that will be revised once there is real behaviour to tune against.

05 · SIX INPUTS, ONE JOURNEY

And a world that *answers.*

Six inputs converging on one output is an argument. This is the form it takes on the screen. The home screen is one place — a river running out to a palm shore — photographed at four times of one day, turning with the member's own clock. Four of the six habits then change what is in it.

MORNING

DAY

EVENING

NIGHT

What each habit changes

Hydration is the river — bank to bank on a good week, a thread on a wide bed on a poor one. Sleep is the sky: last night decides how much of it is there at all. Breathing is the air between here and the headland. Community is the fire on the bank. Steps are the road itself.

Nothing is ever taken away

The air thickens, the river narrows and the sky empties — but the air never goes dark, the river never dries, and the road never moves backwards. A layer that can be lost is a streak with better art, and the streak is the mechanic this product is a correction of.

Why it is not a chart

Nothing new is measured: every layer reads a figure the matching habit already reports. The test is whether a member can tell, in the second before they focus, whether the week has gone well. If it needs a legend to be read, it is a dashboard — and a dashboard is what they already have.

06 · JOURNEYS

Bangkok to Phuket is Journey one. *Not the last.*

A Journey is a real route walked with real habits. The launch Journey covers nine hundred kilometres and six waypoints. Reaching Phuket does not close the experience — it opens the next Journey, which is why the format does not exhaust itself.

THE LAUNCH JOURNEY · 900 KM

0 km	Bangkok	Where every member starts, whatever their pace.
76 km	Ayutthaya	The ancient capital. Close enough to reach in the first weeks.
199 km	Hua Hin	The coast begins, and so does the first long stretch.
544 km	Surat Thani	Halfway. The point at which the habit is usually the reason, not the goal.
782 km	Khao Lak	Onto the peninsula, with the destination in sight.
900 km	Phuket	Where the Sanctuary is planned — and where the next Journey opens.

The gaps between waypoints are uneven because the route is real. At a target pace of roughly eight thousand steps a day, the launch Journey takes about a hundred and fifty days — long enough that finishing it means something.

A format, not a route

The same architecture supports routes that are culturally or personally meaningful anywhere — a Himalayan approach, the length of Britain, a pilgrimage road, a coast-to-coast crossing — each with its own habit weightings and its own waypoints. Those are illustrations of what the format can carry, not a release schedule.

Status

The launch Journey's route, waypoints, boost values and quest catalogue are specified and are being implemented. It is the only route being built for the first release, and none of it is playable today. The pace figures above are design targets drawn from the product specification, not measured behaviour.

07 · LEARNING

Understanding is what makes a habit *survive.*

A habit built on motivation ends when the motivation does. A habit built on understanding does not. Learning is the layer that turns a tracked behaviour into a decision a member can defend to themselves on the week when they least feel like it.

TRACK 01

Behavioural Wellness

How the body actually works — sleep, nutrition, movement, breathwork, the nervous system, recovery and mental fitness. Written so that the measure of a lesson is whether it still changes anything three weeks later.

Ten lessons at pilot launch, inside a track specified across four depth levels.

TRACK 02

Digital Sovereignty

What a blockchain is, how tokens work and why digital ownership matters — written for people who have never touched any of it and have no intention of pretending otherwise.

This is why a member can arrive knowing nothing about the ownership layer and still choose it later, informed rather than persuaded.

20
Lessons at pilot launch, ten in each of the two tracks.

4
Depth levels specified within each track, so the curriculum has somewhere to go.

100%
Credit-earning — every completed lesson is recognised participation.

0
Prior knowledge required. No wallet, no jargon, no crypto literacy.

PILOT SCOPE, ON PURPOSE

The curriculum is specified across both tracks and all four depth levels. The pilot deliberately launches with twenty lessons — enough to test engagement, completion and what people actually do with what they learn, before committing production budget to a larger library. The library then expands on what the first cohorts show rather than on what was guessed in advance.

Why learning is structural

One curriculum does three jobs. It is the depth a member pays for inside the app; it is the material a Sanctuary guest works through in person; and it is the first category a member can produce themselves as a contributor. That is why learning is treated as part of the system rather than as a content cost sitting beside it.

STATUS. NO LESSON HAS BEEN PUBLISHED AND NO LEARNING OUTCOME HAS BEEN MEASURED. THE TRACKS, THE DEPTH LEVELS AND THE TWENTY PILOT LESSONS ARE SPECIFIED; PRODUCTION IS IN PROGRESS. ANY CLAIM ABOUT WHAT THIS CURRICULUM ACHIEVES WOULD BE A CLAIM ABOUT SOMETHING THAT HAS NOT HAPPENED YET.

08 · COMMUNITY AND ACCOUNTABILITY

Accountability that depends on motivation is *fragile.*

Accountability that is structural — because other people are expecting you — is not. That is the whole reason the community layer is part of the architecture rather than a forum bolted onto a tracker.

Four ways to be part of it

01

Participate

EVERY DAY

Daily quests across the six habits — Move, Rest, Breathe, Hydrate, Nourish and Community. Available to everyone, from the first day, at no cost.

02

Learn

ALONE OR IN A COHORT

Two curriculum tracks across four depth levels each, worked through privately or alongside a group moving at the same pace.

03

Contribute

IF THEY CHOOSE TO

Content, programmes, events and initiatives produced by members for members, under the mechanism described overleaf.

04

Govern

INTRODUCED IN STAGES

A widening say in what gets built, opened progressively rather than announced as decentralised on day one.

Why this gets better as more people arrive

"Network effect" is claimed far more often than it is earned, so it is worth naming the mechanism rather than asserting the label. DAOasis is designed to strengthen with participation for one concrete reason: a meaningful share of what the ecosystem offers is produced by the people inside it.

Cohorts, challenges, check-ins and accountability only exist if people show up for each other. Learning depth, marketplace supply and community programming are intended to come substantially from contributors. And access to the parts that are genuinely constrained — Sanctuary cohorts, curated marketplace positions, ambassador territories — becomes more meaningful, not less, as more members qualify for it.

THE HONEST COUNTERPART

That mechanism only works if the caps stay real. The moment capacity is quietly loosened to chase revenue, the argument collapses into ordinary designed scarcity and the ecosystem becomes a loyalty scheme with a better vocabulary.

Holding those limits is a discipline the company has to keep choosing. There is no structural mechanism that enforces it today, and calling it anything other than a genuine execution risk would be dishonest.

STATUS. THERE IS NO COMMUNITY TODAY, BECAUSE THE APP IS NOT RELEASED. COHORTS, CHALLENGES AND THE ACCOUNTABILITY STRUCTURES AROUND THEM ARE SPECIFIED IN THE PRODUCT DESIGN. NO CLAIM IS MADE HERE ABOUT ENGAGEMENT, RETENTION OR OUTCOMES, BECAUSE NONE HAS BEEN MEASURED.

09 · CONTRIBUTION AND THE MARKETPLACE

Most products offer one role. *Customer.*

DAOasis is designed to offer a second one. A member who has genuinely participated can put forward and deliver approved contributions to the ecosystem itself, rather than only consuming what the company produces. The mechanism is called **Stake to Create**.

01

Content and education

Curriculum modules, guided sessions and practitioner-led material inside the learning tracks.

02

Products and experiences

Offerings that reach the ecosystem through the marketplace rather than around it.

03

Events and community

Cohorts, challenges, local gatherings and the accountability structures around them.

04

Ecosystem initiatives

Partnerships, ambassador territories and projects that widen what DAOasis can offer.

How the mechanism is meant to work

A contributor stakes $DVT behind a proposal. The stake is what makes the commitment real; an approval step is what keeps quality controlled. Neither is a barrier to using DAOasis — contribution sits at the far end of the system, and a member never has to reach it.

The commercial logic is straightforward. Content, programming and community depth are the expensive parts of a wellness business, and they are exactly the parts that must keep growing for people to stay. A model in which the most engaged members can help produce them is structurally different from one where a company has to buy all of it.

What is deliberately not designed in

There is no mechanism by which staking earns a return. Staking is used for alignment, eligibility and access, and no yield, interest or payment is offered for it anywhere in the design.

Marketplace fee rates, revenue splits, creator tiers, staking thresholds and the rules for withdrawing a stake are all unresolved. They interact, so setting any one of them in isolation would be guesswork. The **Tokenomics Paper 2026** records each as an open item rather than filling it with a plausible number.

IN DESIGN · NOT OPERATIONAL

Neither the marketplace nor Stake to Create exists today. Both depend on $DVT, which does not exist on any chain, has no deployed contract and will not launch before counsel review and an independent audit are complete. Nothing on this page is available to a member, and no date is committed to.

10 · THE SANCTUARY

Optional. Physical. *Planned.*

A wellness app whose reward is only more app has a ceiling. One with somewhere a member can actually stand does not. The Sanctuary is the physical expression of the ecosystem — and going there is a choice, not a step every member is expected to reach.

It is a behavioural immersion environment rather than a property thesis: it accelerates onboarding, deepens commitment, tests the methodology in person and gives the community a centre of gravity. A seven-day rolling programme brings recovery, learning, accountability and community into one rhythm. The programme is rolling rather than cohort-based, so guests join a rhythm already in motion.

01 **Phuket, after a partner test**

Where the launch Journey leads. An established wellness-tourism destination with mature hospitality infrastructure and strong international access.

02 **Sixteen rooms. Adults only.**

Built around an experiential sweet spot of ten to fifteen guests. The ceiling is physical and real, which is precisely what makes access worth having.

03 **Booked and paid in ordinary money**

Stays are paid in fiat, through a separate Thai company formed when a property is contracted. $DVT carries *access* — eligibility and priority — and is not the payment rail. No token is required to book anything.

04 **Asset-light by intent**

Leased or partnership-based rather than owned, and held in that separate company so hospitality risk never touches the digital ecosystem.

FOUR FOUNDATIONS

Recovery creates space.
Learning creates understanding.
Accountability creates action.
Community creates continuity.

THE SANCTUARY IS PLANNED, NOT OPERATING

No property has been contracted, no lease signed and no facility confirmed. There are no bookings, no published prices and no opening date. It is tested first through a partner, with no capital in a venue. The room count and programme shape above are design intentions. Nothing here should be read as an invitation to book, reserve or pay for anything.

11 · FROM USER TO STAKEHOLDER

Four stages, and nobody has to *climb them.*

A member can stop at any of these and lose nothing. That is not a fallback position — it is the design. Requiring a wallet at the door would shrink the top of the funnel before the product has had a chance to prove the habit works at all.

Why the door has to stay open

The people this product is for are, by definition, short of attention and structural support. Asking them to understand a wallet before they can track a night's sleep would select for the wrong audience and lose the right one. Everything on the ownership side of the system is reached from inside the health product, never before it.

Why the top of the staircase matters anyway

Because the alternative is a company that extracts value from behaviour and hands nothing back. The people who make an ecosystem worth joining — the ones who teach, host, moderate and keep showing up — should be able to hold a position in it. That is the difference between a customer base and a community.

Status

Stage 01 is in build. Stage 02 ships with the app, since Reward Credits are the first reward mechanic to be implemented. Stages 03 and 04 both depend on $DVT, which does not exist yet and will not exist before counsel review and an independent audit are complete.

12 · RECOGNITION, AND OWNERSHIP

Two layers. *Two jobs.*

DAOasis has two distinct things, and treating them as one is the fastest way to misunderstand the company. Reward Credits are the everyday recognition layer. $DVT is the on-chain layer. They are not two names for the same asset.

LAYER ONE

DRC

DAOASIS REWARD CREDITS

Earned through meaningful participation — routines, quests, learning, waypoints, community activity and contribution. Credits live inside the app, are subject to daily caps, and open DAOasis experiences and benefits.

What DRC is not. Not a cryptocurrency. Not transferable, not tradeable, not a financial instrument. No monetary guarantee, no market price, not redeemable for cash and no right to any payment.

LAYER TWO

$DVT

DAOASIS VALUE TOKEN

The on-chain layer, carrying the deeper mechanics: marketplace, governance, staking for access, Stake to Create and ecosystem contribution. A single token with a fixed maximum supply, minted at genesis — an earlier dual-token model was retired in favour of it.

What $DVT is not. Not an investment product and not a store of value. Not offered by this document. It does not exist on any chain today and no contract is deployed. DAOasis publishes no price, yield or return expectation of any kind.

The bridge between them

Conversion from Reward Credits toward $DVT is designed as an **optional, one-way pathway** for members who choose to take it. It runs from participation toward ownership and never back. A member who never crosses it is not a lesser member — they are the ordinary case.

The mechanics are unresolved: the rate, the caps, the eligibility test and the timing. All are subject to legal review, and nothing here is a commitment to a rate or a date.

WHERE THE FIGURES LIVE

This paper states the model and does not repeat its numbers. Supply, allocation, vesting and unlocks, treasury policy, staking parameters, the supply sinks and the full governance specification are set out once, in the **DAOasis Tokenomics Paper 2026**. One place for a number is the only arrangement in which two documents stay honest with each other, and where that paper and this one appear to differ on the token model, that paper governs.

SAID PLAINLY

Whether $DVT may lawfully be offered, and where, **has not been determined**. No counsel opinion has been obtained and no smart contract audit has been carried out. There is no exchange relationship, no listing planned or promised, no market maker and no liquidity commitment of any kind.

13 · GOVERNANCE, IN PHASES

Decentralisation is an outcome, not a *launch.*

Handing full control to token holders on day one of a product that has no members yet is not decentralisation — it is an absence of anybody accountable. Governance is therefore introduced in stages, and each stage has to be earned by the one before it.

PHASE 01

Founders-led

WHERE IT STARTS

The core team decides. The community forum is advisory, and holders are kept informed rather than consulted. This is the honest description of a company with no members yet.

PHASE 02

Community advisory

FIRST REAL VOICE

A council is formed and smaller proposals are put to a vote. Treasury decisions stay gated, because the treasury is what funds the thing everyone is voting about.

PHASE 03

Partial DAO

MOST DECISIONS MOVE

Most proposals are decided by vote, with weight following stake, and the council executes what passes. The company still carries the obligations that cannot be voted away.

PHASE 04

Full DAO

IF IT IS EARNED

Holders decide, and the treasury moves on chain. The board either dissolves or serves the DAO. This is a destination, not a promise, and it depends on everything before it working.

What holders would and would not decide

The intended scope is the things a community can legitimately own: the community treasury and grant budgets, reward-category weightings, partner campaigns, and what gets built next. The scope does not extend to statutory obligations, employment, safety, licensing or anything a regulated company must answer for itself — and any document that implied otherwise would be describing a structure that does not exist.

Capture, and the partial defence against it

Where voting weight follows stake, the largest holders have the most say. Quorum and supermajority requirements raise the cost of capture without preventing it, and it is worth saying so rather than presenting them as a solution. The more meaningful protection is that the great majority of supply is directed at the ecosystem, community, creators and partners rather than at insiders — but that only becomes real once those tranches are actually distributed.

NOT LEGALLY SCOPED

Whether governance as designed constitutes a regulated activity, whether voting weight tied to a held token changes that answer, and which legal entity an on-chain vote would actually bind, have not been reviewed by counsel. Governance parameters — proposal thresholds, quorum, passing majorities, timelocks — are working figures in the Tokenomics Paper and are explicitly illustrative. Quorum in particular is the parameter most likely to be wrong on first setting, because a quorum that is never met is the same as having no governance at all.

14 · HOW DAOASIS EARNS

People paying for something they *value.*

A wellness business funded by selling its own token to its own users is a different, and considerably weaker, proposition than one funded by people choosing to pay for something. Every stream below is fiat, and every one of them is proposed, planned or exploratory: DAOasis is pre-revenue, and nothing here has been earned or tested.

STREAM	STATUS	HOW IT IS INTENDED TO WORK
Membership	Proposed	The first stage of every Journey is free; membership continues the route, with further Journeys, the deeper curriculum, insights and small accountability Circles. The primary long-term scalable line.
Education and cohort learning	Planned	Guided cohort programmes across both curriculum tracks, sold separately from the membership.
Sanctuary experiences	Partner test	Stays and programme fees, paid in fiat; tested first through a partner, with a site only on evidence. Dependent on a property and licences that do not yet exist.
Wellness and brand partnerships	Exploratory	Practitioners, recovery and wearable brands, hospitality partners and team memberships for employers. No partnership is contracted.
Marketplace and ecosystem	Longer term	Marketplace infrastructure and ecosystem utilities. Both sit after $DVT, and therefore after legal review.

Free to start

Every member walks the first stage of a Journey free, with all six inputs counting. Membership continues the route. Those who do not pay keep their check-in, their community and their Reward Credits, which are earned at the same rates whether a member pays or not.

Cost of supply falls as the base grows

Content, programming and community depth are the expensive parts of a wellness business, and the parts that must keep growing for retention to hold. If Stake to Create works, the marginal cost of the thing that drives retention falls as the member base rises. That is the bet, stated as a bet.

No revenue comes from the token

$DVT is not a revenue line. DAOasis does not present token proceeds as trading revenue, and the membership and Sanctuary stays are paid in ordinary money. Staking adds perks on top of a member's tier; it never unlocks or discounts the membership.

STATUS. PRICES AND CONVERSION ASSUMPTIONS ARE PROPOSED INTERNALLY AND NONE HAS BEEN TESTED WITH A MEMBER. THE COMMERCIAL DETAIL BEHIND THIS PAGE — THE FINANCIAL MODEL, THE FUNDING SEQUENCE AND THE USE OF FUNDS — BELONGS TO THE INVESTOR READY BUSINESS PLAN 2026 AND IS DELIBERATELY NOT REPRODUCED IN A PUBLIC DOCUMENT.

15 · ARCHITECTURE

Requirements, *not choices.*

Most whitepapers name a chain on the first page. This one cannot honestly do that: the chain, the wallet connection method, the hosting arrangement and the data residency are undecided, and the Chief Technology Officer role is open. What can be published is the shape any answer has to fit — and the one boundary that will not move whatever the answer turns out to be.

LAYER 01 The device	WHAT LIVES HERE Health and activity data is generated here, and stays under the member's own permission. Apple HealthKit and Google Health Connect are the two priority integrations.	NOT YET DETERMINED Which further platforms follow, and in what order.
LAYER 02 The Companion App	WHAT LIVES HERE The daily loop, quests, the Journey marker, learning, community and the Reward Credit record. Everything a member actually uses lives at this layer.	NOT YET DETERMINED Nothing structural. This layer is in build.
LAYER 03 DAOasis systems	WHAT LIVES HERE Accounts, the credit ledger, curriculum delivery, community, marketplace logic and the conversion gate. Personal data is held here, under normal data-protection duties.	NOT YET DETERMINED Hosting arrangement, data residency, transfer mechanism and retention schedule.

HEALTH DATA NEVER CROSSES THIS LINE — NOTHING IDENTIFYING GOES ON CHAIN

LAYER 04 A public chain	WHAT LIVES HERE The token contract, staking, governance votes and on-chain settlement. Addresses and balances — nothing that identifies a person and nothing about their health.	NOT YET DETERMINED The chain itself, the wallet connection method, and the entity that would issue.

Four requirements that are fixed

One. Core use of the app never requires buying or holding a token. **Two.** Health data is read under permission and is never written to a chain. **Three.** An independent third-party audit of the contracts and the surrounding architecture is completed *before* deployment, not after it. **Four.** The app ships before the token, and leads it.

Two the choice has to satisfy

Whatever chain is chosen has to make a wallet unnecessary for the great majority of members, which means custody and connection are a product problem before they are a technical one. And it has to keep transaction costs low enough that ordinary participation is not priced out — a governance vote that costs more than it is worth is not a vote.

Why this section is short

Because inventing an architecture would be the single most damaging thing this document could do. A named chain here would be quoted back as a decision, and the person who has to live with that decision has not been appointed yet. It will be published when it is made.

16 · HEALTH DATA AND PRIVACY

Health data is the most sensitive thing here. *It is treated that way.*

A product built on sleep, movement, hydration and recovery is a product built on special-category personal data. That carries obligations, and the honest position is to state both what is settled and what is not.

Settled

01 **Read under permission, not harvested**

Read through platform integrations the member connects and can disconnect. Nothing leaves a device without that permission first.

02 **Never written to a blockchain**

DAOasis has no product that writes health data to a chain. A public ledger is permanent and world-readable, which makes it the wrong place for anything about a person's body.

03 **No cookies, no analytics on the website**

Verified against the source rather than asserted. If it ever changes, the cookie and privacy pages are updated before the change goes live.

04 **Digital sovereignty is a direction, not a feature**

DAOasis teaches what digital ownership is and why it might matter. It does not claim to have shipped a sovereign health-data product.

Not settled

05 **Retention, residency and transfers**

How long each category is kept, where it is hosted, the transfer mechanism between jurisdictions, and the processor list.

06 **Consent mechanism and minimum age**

The lawful basis and additional condition for special-category data, the consent flow, and the minimum account age. All require counsel.

07 **Impact assessment and governance**

An impact assessment, and whether a data protection officer is required, follow from decisions about scale that have not been taken.

08 **No legal review has taken place**

The trust and legal pages are drafted but not reviewed by qualified counsel. DAOasis holds no certification and makes no compliance claim.

Why this is published rather than tidied away

A privacy position that quietly omits its own unresolved items is worse than one that admits to them. Every open item above appears as a visible marker on the public trust pages too, and each is tracked rather than hoped away.

No medical claim

DAOasis makes no medical claim and offers no diagnosis or treatment. Nothing in this document, or in the product it describes, is a substitute for professional healthcare advice.

17 · HOW THE COMPANY WORKS

Technology changes. Principles *should not.*

The way DAOasis is built is not separate from what it is building. An ecosystem that asks people to be consistent has an obligation to be consistent itself, and to be legible about how it makes decisions.

01 **Clarity over complexity.** If it cannot be explained simply, it is not finished.

02 **Quality over speed.** Shipping the wrong thing early costs more than shipping the right thing late.

03 **Long-term value over short-term gain.** Which is why there is no price on any page of this document.

04 **Systems over heroics.** A process that only works when one person is present is not a process.

05 **Evidence over opinion.** And where there is no evidence yet, saying so rather than filling the gap.

06 **Trust is earned through consistency.** Both from members, and from the company toward them.

One place for every fact

Every important piece of company information exists once, with one owner and one approved version. Everything else references it rather than copying it. That is why this paper points at the Tokenomics Paper for the token figures instead of restating them — two copies of a number is how two documents start disagreeing.

Ownership, not committees

Every asset, project, document and decision has a named owner. Where a role is not filled, that is stated rather than absorbed — the Chief Technology Officer role is open today, and this paper says so on the page where it matters most.

Problems surfaced early

Information is shared openly unless there is a legal or commercial reason not to, and problems are raised before they are solved rather than after. The open items scattered through this document are that principle applied to a public document.

THE MISSION, STATED ONCE. TO BUILD A WELLNESS ECOSYSTEM WHERE PEOPLE CAN REST, LEARN, EARN AND RETURN — THROUGH EXPERIENCES THAT IMPROVE WELLBEING, UNDERSTANDING AND LONG-TERM PERSONAL GROWTH.

18 · WHAT EXISTS TODAY

Past concept. *Into build.*

DAOasis has moved beyond concept development: the UK company is live, the brand and the website are public, the product is specified in full, and MVP design handoff is complete. It is not yet in market, which means there are no members, no revenue and no usage to report. Both halves of that sentence matter.

BUILT

- DAOasis Global Ltd (UK), incorporated and live.
- Brand, positioning and the messaging system.
- A public website across thirteen pages, including a full trust and legal layer.
- The Companion App's MVP design: 74 screens, and a clickable web prototype.
- The App Product Logic — every rule the screens run on.
- The quest system, across the six habits with three-tier verification.
- The credit economy: an award table and daily caps, with no streaks.
- Two curriculum tracks, specified across four depth levels each.
- The token model, published in full as the Tokenomics Paper 2026.

IN DEVELOPMENT

- MVP build, from the completed design handoff.
- Working end-to-end flows for the core daily habit loop.
- Reward Credits — the first reward mechanic to ship.
- Apple HealthKit and Google Health Connect integration.
- The launch Journey, playable from Bangkok to Phuket.
- Twenty pilot lessons across the two curriculum tracks.
- A BVI holding company, with early holders re-signed into it.
- The legal and structural groundwork for $DVT.

NOT STARTED, AND NOT CLAIMED

- No members, no users and no waiting-list conversion.
- No revenue, and nothing has been sold at any price.
- No token exists on any chain, and no contract is deployed.
- No contract audit has been carried out and no firm engaged.
- No counsel opinion has been obtained on any question here.
- No property is contracted, leased or reserved in Phuket.
- No partnership, integration agreement or exchange relationship.
- No lesson published and no learning outcome measured.

THE CORPORATE STRUCTURE, AS IT STANDS

DAOasis Global Ltd (UK) is the set-up company and carries every agreement today. The business moves under a **BVI holding company**, and the UK company then closes. Members keep the consumer protections of where they live. A **Thai operating company** waits on a contracted property.

THE TEAM, AS IT STANDS

DAOasis is a small team carrying an app, a token layer, a curriculum, a community and a hospitality pilot. The **Chief Technology Officer role is open**, which is why section 15 publishes architectural requirements rather than architectural decisions. Every remit has a named owner, and where one is unfilled this document says so rather than absorbing it.

WHY THE THIRD COLUMN IS THE LONGEST. A PRE-LAUNCH COMPANY THAT LISTS ONLY WHAT IT HAS BUILT IS DESCRIBING HALF A POSITION. EVERYTHING IN THAT COLUMN IS A THING A READER MIGHT REASONABLY ASSUME EXISTS, AND NONE OF IT DOES.

19 · WHAT HAS TO BE TRUE NEXT

Gates, *not dates.*

Each line below is a condition rather than a deadline. The dates are working internal targets and they move if the conditions do — which, for the token track in particular, is the entire point of sequencing it this way.

HORIZON	MILESTONE	WHAT HAS TO BE TRUE BEFORE IT COUNTS AS DONE
Now	Foundations	The business moved under a BVI holding company, early holders re-signed into it. The Companion App built and launched. Consumer, data and token positions reviewed by counsel.
Working target	App launch	The daily habit loop working end to end. Reward Credits live. HealthKit and Health Connect integrated. The launch Journey playable. Twenty pilot lessons published.
After traction	$DVT structure	No launch date. Legal structure confirmed and audit-ready, eligible jurisdictions determined — only once the app has traction and after counsel sign-off. Not a public sale.
On evidence	The Sanctuary	A partner-hosted test first; a Phuket site, licensing and a programme only once the evidence justifies it.
Beyond	Scale	Marketplace and Stake to Create. Governance widening in phases. Further Journeys and further Sanctuary locations. A wider partner and practitioner network.

The app leads the token

Deliberately, and with no token date set. If the daily loop does not earn its engagement on wellness merit alone, no ownership layer rescues it — and launching the token first would invite exactly the audience the product is not built for.

Audit before deployment

An independent third-party audit of the contracts and the surrounding architecture is completed ahead of any deployment rather than after it. That is a sequencing decision rather than a budget line, and it is not negotiable against a date.

On dates generally

Dates are working internal targets, not commitments. The token has no launch date: it is gated on traction and on completing legal review. Nothing in the later rows is contracted, funded or promised.

NOT ON THIS PAGE. THE FUNDING SEQUENCE BEHIND THESE GATES — WHAT IS RAISED, WHEN, ON WHAT INSTRUMENT AND AGAINST WHICH MILESTONE — BELONGS TO THE INVESTOR READY BUSINESS PLAN 2026 AND IS DELIBERATELY ABSENT FROM A PUBLIC DOCUMENT.

20 · WHAT COULD GO WRONG

The most useful page in the *document.*

A pre-launch company's risk register is the part most worth reading, so this one is deliberately unflattering. Each mitigation is what is *designed*, not what has been shown to work — nothing here has been tested in market.

CATEGORY	RISK	MITIGATION, AS DESIGNED
Product	The daily loop does not retain. Wellness-app retention is poor, and the Journey mechanic is unproven.	The app is built first and alone, so the question is answered before anything downstream is committed to.
Regulatory	$DVT may be a regulated instrument in some or all target jurisdictions, restricting or preventing the ownership layer.	No public token activity before counsel review. The app works fully without $DVT, so an adverse opinion delays a layer rather than ending the business.
Regulatory	Health data is special-category data. Consent, retention, residency and transfer obligations are unresolved.	Read under member permission, never written to a chain. The trust layer is drafted and counsel review is the next step.
Technology	Contract or platform failure. Contracts can contain flaws, and a confirmed on-chain transaction cannot be reversed.	Independent audit before deployment; the app ships first and the token waits for traction.
Technology	Integration dependency. The core mechanic reads from Apple and Google platforms the company does not control.	Two priority integrations rather than one, with manual logging and honour-system verification designed in as fallbacks.
Operational	The Sanctuary pilot is unsecured. No property, lease, licence or fit-out cost is settled.	Asset-light by intent, designed for a separate Thai company — formed with the property — so hospitality risk never reaches the digital ecosystem.
Execution	A small team carrying wide scope, with the Chief Technology Officer role open and several remits resting on one person.	Explicit sequencing: one near-term product, everything else gated behind it, with a named owner for each remit.
Execution	Capacity discipline may not hold. The argument collapses if caps are quietly loosened to chase revenue.	Acknowledged in public as a discipline the company has to keep choosing. No structural mechanism enforces it today.

RISKS WITH NO MITIGATION BEYOND SEQUENCING

Several items above have no mitigation other than the order things are done in. Named together: there is **no proven retention, no validated price, no contracted property, no legal opinion and no completed audit**. Any one failing would change the shape of what this document describes.

GLOSSARY

Every term, defined *once.*

These are the definitions the rest of the DAOasis document set uses. Where another document appears to use one of them differently, this page is the one to work from.

DAOasis
The ongoing ecosystem: the Companion App, the recognition and ownership layer, the community, the marketplace and the Sanctuary.

Journey
A repeatable immersive experience inside the ecosystem, walked with real habits along a real route. Completing one opens the next.

The launch Journey
Nine hundred kilometres from Bangkok to Phuket, across six waypoints. The first instance of the format, not the product itself.

Companion App
The core operating environment, and the foundation every later product reaches the member through. Free, and no wallet required.

Quest
A daily action in one of the six habits — Move, Rest, Breathe, Hydrate, Nourish, Learn — verified automatically, by member log, or on trust.

Waypoint
A named point on a route, at its true proportional distance. The launch Journey has six.

DRC · DAOasis Reward Credits
The in-app recognition layer, earned through participation. Non-transferable, not a cryptocurrency, no market price and no monetary guarantee.

$DVT · DAOasis Value Token
The on-chain layer: marketplace, governance, staking for access and Stake to Create. One token, fixed maximum supply, minted at genesis.

Conversion
The designed, optional, one-way pathway from Reward Credits toward $DVT. Rate, caps, eligibility and timing are unresolved and subject to legal review.

Stake to Create
The mechanism by which a member stakes $DVT behind an approved contribution — content, products, events or initiatives — and delivers it.

The Sanctuary
The optional physical expression of the ecosystem, designed as a sixteen-room site in Phuket and tested first through a partner. Booked and paid in fiat.

Marketplace
The planned venue through which member and partner offerings reach the ecosystem. In design; not operational.

Member
Anyone using the Companion App. Members move, by their own choice, through four stages: **user**, **participant**, **contributor**, **stakeholder**.

Governance phases
The four stages by which decision-making widens: founders-led, community advisory, partial DAO, full DAO.

Settled · designed · undetermined
Settled means a decision taken. **Designed** means specified but not built. **Undetermined** means nobody has decided, and no figure has been invented to stand in for one.

Illustrative
A working figure used to test whether a design holds. Not a commitment or a forecast, and not to be quoted as a rate.

Two names that are retired

DRT and **"Digital Wellness Token"** appear in older DAOasis material and in some legacy mockups. Neither is current: the token is $DVT and the credit layer is DRC.

One word used carefully

A member *completes* a Journey, reaches a milestone or arrives at a destination — and the next Journey opens. Nothing in DAOasis finishes, which is why this document avoids the language of last stops.

The rest of the document set

The **Investor Ready Business Plan 2026** carries the commercial position, the market, the team and the raise. The **Tokenomics Paper 2026** is the token model of record. Where either disagrees with this paper in its own domain, it governs.

IMPORTANT INFORMATION

Please read this *carefully.*

This document describes an ecosystem that is partly built, partly designed and partly undetermined. It is not an offer, it is not a financial promotion, and it is not advice.

Not an offer, and not a promotion

Published for information only. It is not an offer to sell, or a solicitation of an offer to buy, any security, token or other instrument in any jurisdiction, and it is not investment, financial, legal or tax advice. It is not a financial promotion or an inducement to engage in any investment activity.

$DVT is not offered here

$DVT does not exist on any chain today and no contract is deployed. Whether $DVT may lawfully be offered, and where, **has not been determined**; **no counsel opinion has been obtained**; **no smart contract audit has been carried out**. No price, yield, APY, market capitalisation, projected return, floor, stability claim, liquidity commitment or exchange listing is stated or implied anywhere, because none exists.

Reward Credits

A non-transferable in-app mechanic. Not a cryptocurrency, not a financial product, carrying no monetary guarantee and no market price. Not redeemable for cash and conferring no right to any payment. Nothing about them is wages, interest or a return.

Illustrative figures

Figures described as illustrative — staking thresholds, fee ranges and governance parameters referenced from the Tokenomics Paper — are working inputs, not commitments or forecasts, and should not be quoted as rates.

Forward-looking statements

Statements about future products, mechanics, timelines and markets are forward-looking and subject to change, including as a result of legal and regulatory review. Features described as planned, in development or in design are not available today. Dates are working internal targets, not commitments.

Stage of the company

DAOasis is pre-launch, with no revenue and no members. DAOasis Global Ltd (UK) is the set-up company; the planned BVI holding company and the Thai operating company are not yet formed. No property is contracted for the Sanctuary. No traction, partnership, funding, integration, exchange relationship, audit or legal opinion is claimed here.

No medical claims

DAOasis makes no medical claim and offers no diagnosis or treatment. Nothing here is a substitute for professional healthcare advice. DAOasis does not store health data on a blockchain and has no product that does.

No legal review

This document, and the public trust and legal pages it draws on, have not been reviewed by qualified legal counsel. DAOasis holds no security certification and makes no compliance claim.

Third-party figures

Market figures at section 02 are third-party references, attributed on the page, indicating category scale only. They are not DAOasis forecasts, addressable-market claims or statements about any share of any market.

Read alongside. The **Tokenomics Paper 2026** is the token model of record and carries every figure this paper does not repeat. The **Investor Ready Business Plan 2026** is the commercial source of truth, available for diligence on request. Where either disagrees with this document in its own domain, it governs.

ENQUIRIES
info@daoasis.xyz

IN CLOSING

Participation that *compounds.*

Every positive action moves a member forward. Rest and movement and hydration and breathing and learning all feed the same Journey, and together they compound. Nothing done well is wasted — and when one Journey is complete, the next one opens.

What this is for

To make it possible for the people who build an ecosystem to hold a position in it — without asking anybody to buy anything in order to begin. Everything in this paper is machinery in service of that one idea.

What it is not for

Speculation. There is no price here, no market, no yield and no return, and the design goes out of its way to make sure participation never becomes arithmetic about money.

What happens next

The app ships first. Counsel review and an independent audit gate the token track, and they move when they move. Everything undetermined in this document is published as undetermined until it is decided.

Rest. Learn. Earn. *Return.*

Questions about anything in this document are welcome, including the parts of it that are not decided — and the honest answer to several of them today is "not yet". The Tokenomics Paper 2026 carries the token model in full; the Investor Ready Business Plan 2026 is available for diligence on request.
